CECROPIA UTCUBAMBANA Cuatr. sp. nov.

Arbor 10 m alta. Rami terminales robusti circa 3-4 cm diam ochraceo-virides nodis 12-25 mm longis laevibus puberulis pilis teneris minutis vel minutissimis acutis albis vel hyalinis et pilis crassis brunnescentibus sparsis vel copiosis muniti. Stipula terminalis viridi-ochracea 8-10 cm longa extus minute puberula pilis crassiusculis ferrugineis minutis sparsis, intus sericea pilis rectis rigidulis acutis albo-hyalinis 1-2 mm longis prostratis copiose vestita.

Folia chartacea peltata utrinque viridia. Lamina usque ad 62 cm longa 60 cm lata 9-10-costata usque medium vel ad 2/3 lobata, lobis radiatis ellipticis vel elliptico-obovatis ad apicem attenuatis obtusisque ad basim plus minusve angustatis; lobi maximi ab insertionem petioli usque ad apicem 32-37 cm longi parte libera 13-16 cm lati, minimi 11-19 cm longi 6-9 cm lati, parte centrali integra inter lobos maiores 10-16 cm, inter minores 6 cm radii; margo leviter sinuata papillosa et breviter piloso-araneosa; adaxiale in vivo viridissima, asperrima pilis brevibus rectis acutissimis hyalinis fragilibus basi conica calcarea indurata persistenti, costa nervisque secundariis filiformibus notatis; abaxiale in juvenilis nervis rubescientibus in adultis omnino pallide viridis, aspectu glabra sed nervis venulisque minutissimis pilis papillosis crassiusculis copiose praedita; costae robustae argute striatae nervi secundarii graciliter prominentes semiteretes microscopice granulati, proximales angulo 55° distales angulo 30° ascendentibus plerumque 1.5-2 cm inter se distantes vel in lobis infimis 1-1.5 cm tantum separati; venae minores subparallelae prominulae 3-4 mm distantes sed interdum venula intermedia magis tenuis adsunt; areolae planae vel leviter convexae virides minutissime sparseque papillosoe. Petiolus robustus 34-53 cm longus argute striatus aspectu glaber sed pilis minutissimis acutis vel obtusis papilliformibus sparsis munitis; pulvinus basalis eminens ferrugineus velutinus pilis patulis rectis acutis uniseriati-pluricellularibus 0.7-1 mm longis congestissime dispositis, interdum corpusculis albidis ellipsoideis 0.2-0.3 mm longis inter tomentum presentibus. In foliis valde juvenilibus (15-20 cm diam) lamina tenella membranacea adaxiale scabra pilis conicis acutissimis minutis copiose munita, abaxiale glabra nervis venisque sparse vel copiose minuteque papilloso-pilosus excepta.

Inflorescentiae femineae 4(-5)-amentiferae longissime pedunculatae pendulaeque, jam maturitate in speciminibus. Pedunculus 36-50 cm longus 4 mm diametro striatus sparse minuteque puberulus

*viridi-ochraceus*. Spathae in specimine absentes. Amenta sessilia teretia 28-32 cm longa 9-10 mm diam, aliquando magis juvenila 20-30 cm longa 7 mm crassa aspectu cinerea sed lana alba inter flores adpressa conspicua, tactu sublaevia (non aspera). Perianthium florum femineum scariosum hyalinum fragile apice calloso-incrassato obtuso vel leviter angulato ochraceo viridulo minute papilloso et dilute arachnoideo, sursum prope marginem copiose albo-lanatum. Stigmata rubescens. Semina ellipsoidea moderate compressa 1.8-2.1 x 1-1.2 mm, interdum adpresse ovoidea 1.3 x 1.7 mm, brunnescens nitida laevia vel partiale sublaevia, conspicue ochroleuco-marginata.

Typus: Peru, prov. Bongará, dept. Amazonas: 4 km below Campamento Ingenio, along Rio Utubamba, 1250 m alt. Tree to 10 m; leaves 10-lobed; veins and petioles of younger leaves reddish; fruit 4-5 fingered. Ants cultivate aphids in cells of stems; these collected in 1 oz. jar. 28 Jan 1964, P.C. Hutchinson & J.K. Wright 3844. Holotype, UC; isotype, US.

Cecropia utcubambana is closely related to few other species also with chartaceous, totally green leaves, subglabrous below and scabrous above, like *C. putumayonis*, *C. setico*, *C. burriada*, and *C. dabeibana*, some of them having also pendulous spadices. The new species differs from them by having the following features together: very long inflorescence peduncles, very long sessile spikes, 9-10 main nerves and leaf-lobes, the lobes broadly elliptic or obovate-elliptic and the petioles and peduncles scabrous. It is expected that male specimens which unfortunately are lacking at present will produce additional characters when collected in the future.

CARRAMBOA TACHIRENSIS (*Aristeguieta*) Cuatr. comb. nov.

Espeletia tachirensis *Aristeguieta*, Compositae in Flora Venezuela 10(1):427. 1964.

Espeletiopsis tachirensis (*Aristeguieta*) Cuatr. Phytologia 35(1):56. 1976.

Recent study of the growth form in the field by the author of this and the following species has resulted in their transfer to Carramboa.

CARRAMBOA WURDACKII (*Ruiz-Terán & López-Figueiras*) Cuatr. comb. nov.

Espeletia wurdackii *Ruiz-Terán & López-Figueiras*, Rev. Fac. Farm. Univ. Andes, Merida 17:1. 1976.

STUDIES IN NEOTROPICAL SENECONAE III.  
NEW TAXA IN SENECONIA, PENTACALIA AND GYNOXYS

Jose Cuatrecasas  
Department of Botany, Smithsonian Institution  
Washington, D. C. 20560

SENECIO HANSWEBERI Cuatr. sp. nov.

Herba rhizomatosa caule lignoso argute nodoso prostrato semi-subterraneo repente plagiotropo cum radicis numerosis subteneris carnosulis geotropis et ramulis brevibus rosulas paucifoliatas terminales gerentibus.

Folia rosularia 9-20 cm longa 4-8 mm lata sessilia. Lamina carnosulo-coriacea rigida oblanceolato-linearis subite acutata marginibus argute revolutis aspectu integerrima basin versus paulo attenuata, adaxiale in adultis viridissima laevis glabra tantum linea media plus minusve impressa, abaxiale costa elevata sicut marginibus retortis viridibus glabrisque ceterum plana alba densissima adpresseque lanata infra indumentum enervia superficie laevi; basis laminae in vaginam ampliata. Vagina membranacea viridula glabra parallela nervata circa 3 cm longa basi ad 8-9 mm lata valde amplectenti.

Caulis florifer terminalis bene foliatus robustiusculus fistulosus striatus rigidus erectisque ad 30 cm longus purpurascens subglaber tantum pilis albis tenuissimis longissimis araneosis dilutis denique deciduis, copiose foliis alternis rosularibus similibus sed sursum gradation brevioribus, medialis ad 12 cm longis superme 6-4 cm x 3-2 mm omnibus ad basim ampliatis vaginatis amplectentibusque. Pars distalis fertilis 5-10 cm longa corymbiforme ramosa, ramis alternis proximalibus 8-10 cm longis vel longioribus 2-3 capituliferis sursum gradatim brevioribus plerumque monocephalos, pedunculis 1-2 cm longis vel longioribus striatis rigidis erectisque. Bractae subtendentes inferiores folia suprema similes 30 x 2-3 mm, lanceolatae sursum minores linearis acutae in pedunculis copiosae, supremae 10-8 x 1-0.6 mm subimbricatae in calyculum gradatim mutantates.

Capitula erecta radiata cylindraceo-campanulata 14-18 mm alta 9-12 mm diametro, circulo ligularum 25-30 mm diam, 137-143 flores ferentia. Calyx 8-10 bracteolis linear-lanceolatis acutis 6-9 x 1.0-1.6 mm, herbaceis crassiusculis viridibus sursum plus minusve purpuraceis glabris (vel marginibus parcis pilis 0.1-0.2 mm)
